## The Full Range of MIL-DTL-38999 Series I, II, III and IV Hermetic Receptacles—*Plus Glenair Commercial Equivalents*

### Product Applications

The MIL-DTL-38999 Series I, II, III and IV family of hermetic connectors are ideal for high-pressure/low-leakage applications in air, sea and space environments. Glenair is on the Qualified Product List (QPL) for all configurations of MIL-DTL-38999 Series I through IV pin and socket hermetic connectors. We also offer our D38999 type commercial part numbers for applications that do not require MS qualified products.

### Materials

Glenair MIL-DTL-38999 Series I, II, III and IV Hermetic Connectors are made of stainless (CRES) or carbon steel (CRS), with glass

Nickel-iron alloy 52 gold-plated contacts, available in sizes 8, 10, 12, 16, 20 and 22D, depending on the layout chosen, offer a wide selection of insert arrangement options. Solder cup, feed through (PCB Flexprint) and eyelet contact styles are also available.

### Same-Day Inventory

Because Glenair makes all its hermetic connectors in-house, including the machining of shells, molding of interfacial seals and firing of hermetic components, we can offer you outstanding availability on stock products and fast turnaround on special orders.

*Same-Day Delivery on Most Common Shell Styles and Layouts*

*Full Range of D38999 Series I thru IV Pin and Socket Insert Arrangements*

*DSCC Approved QPL Hermetics*

*1 x 10<sup>-6</sup> cc/Helium per Second Leakage Rate*

*CRES and CRS Shells with Vitreous Glass Sealing with All Standard Material Options*

*Jam Nut, Solder Mount, Wall Mount and Box Mount Options*

insulators fused to the connector shell, and contacts meeting a leak rate of 1 X 10<sup>-6</sup> cc/Helium per second. Maximum design flexibility is built into the Series I, II, III and IV Military Standard Hermetic Connectors – with a minimum of 2 to a maximum of 128 circuits per connector in a wide variety of contact arrangements IAW MIL-STD-1560. Fluorosilicone rubber interfacial and peripheral seals ensure positive sealing with plug connectors.

*Catalog contents—including part numbers, materials and dimensions—are accurate to the best of our ability when we go to print. Even so, customers are advised to consult the factory for the latest specifications, particularly to confirm critical dimensions such as connector lengths, threads, and so on. When errors or mistakes are brought to our attention, corrected content is posted immediately to [www.glenair.com](http://www.glenair.com).*

### Military Standard Type Series

Glenair's family of circular military standard type EMI/EMP filter connectors is designed to meet stringent military/aerospace performance requirements. Each connector series is offered with standard low-pass Pi or C filter arrays, or with customized filters to meet specific frequency and capacitance requirements. Thermally conductive epoxy protects the filter package from mechanical and heat stress and also provides a waterproof seal. All filtered receptacles are intermateable with standard plugs and connector savers, and each respective series of connectors is supplied with a range of shell styles in both environmental and hermetic configurations. Please see the "How to Order" page for available styles for each series:

## MIL-DTL-38999 Twinax and Quadrax Connector for Reliable High-Speed Applications

### Product Applications

Glenair is recognized as trusted supplier of harsh environment electrical connectors built to the MIL-DTL-38999 standard. Both quadrax and twinax appear to have unique but equally beneficial qualities. The quadrax connector has four pins connected to a single cable, providing two-way Ethernet data communications. The twinax connector with two pins, provides one-way communication. Two twinax connectors and two wires are required for two-way communications which adds up to about 50% more weight than a quadrax connection. Twinax connectors have proven to be highly reliable and easy to maintain. Quadrax connectors are more difficult to maintain in the field and are yet to be thoroughly proven for reliability. Depending on the application, the end user will prefer one or the other (for example,

Airbus prefers Quadrax while Boeing prefers twinax) which is why Glenair offers both.

### Available Insert Arrangements

Based on industry-standard specifications, Glenair's MIL-DTL-38999 derivative environmental class connector systems are supplied with insert arrangements IAW MIL-STD-1560, or appropriate sub-sets depending on connector series. Consult factory for available insert arrangements.

## The Widest Range of MIL-DTL-38999 Type Bulkhead Feed-Thru Connectors Available In The Industry.

### Product Applications

Bulkhead feed-thrus eliminate the need to permanently fix cable harnesses to panels—affording increased system flexibility, superior mechanical integrity, and greater serviceability. Glenair hermetic and environmental bulkhead feed-thru connectors are available in MIL-DTL-38999 Series I, II and III configurations. Hermetic Versions are ideally suited for high-pressure/low-leakage applications in air, sea and space environments, meeting a leak rate of  $1 \times 10^{-7}$  cm<sup>3</sup> per second. Environmental versions offer IP67 level sealing.

# Too Fat to Fly?

## Maybe. But Not Too Big To Be Saved by a Mouse.

One of the biggest challenges facing designers of armored vehicles and other rapid deployment combat platforms is the requirement to build systems which are transportable by air. In critical weight-reduction applications such as these, literally every ounce counts. That's why Glenair invented the Series 80 "Mighty Mouse;" an ultraminiature connector with

all the performance characteristics of standard Mil-Spec products. The "Mighty Mouse" is being used in ground, air and sea applications where extreme levels of weight reduction are not just an option but a necessity. So, if your system is too fat to fly, consider a switch to the mouse. The Glenair "Mighty Mouse": Phenomenal Performance, Itty-Bitty Package.

## The Smart Solution for Preventing Contact Damage and Extending the Service Life of Cable Assemblies

### Product Applications

Glenair Sav-Con® Connector Savers are designed to protect connectors that are subject to repeated mating and unmating cycles. Sav-Con® Connector Savers prevent costly repair or replacement of expensive connectors and cables while preserving the quality and integrity of connector performance. Sav-Con® Connector Savers take the abuse of repeated connection cycles instead of “black box” or other equipment connectors. Equipment connectors that are mated and unmated frequently during manufacturing, check-out phases and environmental test

design adds resistance to a circuit equal to a mated pin and socket contact, thus it has little or no effect on sensitive circuits.

When a Sav-Con® Connector Saver is installed between a receptacle and a plug, the effective additional length is less than the length of an equivalent mated plug and receptacle. When using bayonet coupled Sav-Con® Connector Savers, Glenair recommends our Lock Ring design feature in applications where large cable bundles may

programs can be protected by Glenair Sav-Con® Connector Savers at considerable savings in time and money.

Glenair Sav-Con® Connector Savers feature one-piece, non-removable pin/socket contacts for maximum reliability and minimum effect on circuit resistance. Each Glenair Sav-Con® Connector Saver series meets the same durability requirements as the Military Specification series with which it mates. The mating portions of the pin-and-socket contacts are in strict compliance with the applicable Military Specification contacts used in each connector series. The one-piece

induce unwanted stress to the coupling mechanism and potential unwanted contact displacement (see page E-2).

*Catalog contents—including part numbers, materials and dimensions—are accurate to the best of our ability when we go to print. Even so, customers are advised to consult the factory for the latest specifications, particularly to confirm critical dimensions such as connector lengths, threads, and so on. When errors or mistakes are brought to our attention, corrected content is posted immediately to our website: [www.glenair.com](http://www.glenair.com).*

# Lock Ring Prevents Accidental Disengagement of Mated Connectors

## *For Bayonet Coupling Only*

### The Coupling Nut:

This feature eliminates the wave spring inside the coupling nut, thus providing positive metal-to-metal bottoming out of the plug side of the Sav-Con® Connector Saver to the mating receptacle. This is a desirable option in the following applications:

### Locking a Sav-Con® to a receptacle:

Locking a Sav-Con® Connector Saver to a receptacle can prevent accidental or unauthorized unmating. This can insure that the equipment receptacle remains in its unused condition prior to delivery.

### Locking a Sav-Con® to reduce lateral forces:

Lateral forces caused by a heavy cable can be reduced when the Sav-Con® Connector Saver is locked to the equipment receptacle. On high-density connectors that have a limited pin-and-socket engagement length, the force applied by a heavy cable can collapse the wave spring and create unwanted discontinuities in the mated contacts.

### Locking a Sav-Con® when delivered to end-user:

When equipment is delivered to the end-user, the Sav-Con® Connector Saver may be locked to its mating receptacle to insure that the receptacles mounted on the equipment will remain unused until final installation of the equipment.

### Locking a Sav-Con® to a cable mounted plug:

It is often desirable to lock a Sav-Con® Connector Saver on a cable-mounted plug coupler to prevent accidental disconnect of the Sav-Con®.

### *Sav-Con® Lock Ring Engagement and Disengagement Steps:*

1. To engage the plug portion of the saver, first insure that the Lock Ring (2) is in the fully open position by turning the Lock Ring by hand clockwise until it stops.
2. Couple (1) to the Mating receptacle.  
Note: Pins should be visible in the three holes of the Coupling Ring (1).
3. To lock the Sav-con®, turn the Lock Ring (2) counter-clockwise by hand until it stops. This will seat the bayonet pins.
4. Dis-Engagement is the reverse of steps 3 and 2. Turn Lock Ring (2) to the open position clockwise by hand until it stops. Then rotate the Coupling Ring (1) counter-clockwise until all contacts are separated.

## Because the Art of Interconnect Cable Design Calls for More Technology Than Just a Connector

### Backshells: A Part of Every Well-Designed Cable Harness and Assembly

Glenair understands that the management of EMI, environmental damage and mechanical stress factors in high-reliability cable assemblies usually requires the incorporation of various connector backshells and accessories. We offer thousands of EMI management products, cable-sealing backshells, protective covers, strain-relief devices and other essential accessories. In this section of the book we've organized a small selection of some of the most practical devices used in Mil-Aero cabling. We've chosen the most popular and useful products for assemblies built around the D38999 family.

could include both a suitable EMI filtering device but also an appropriate selection of accessories such as shield termination backshells, EMI gaskets and conductive shielding.

For environmental protection, Glenair offers both standard shrink-boot products as well as more robust cable-sealing backshells and protective covers. For mechanical protection we offer a broad range of strain-relief backshells to prevent damage to the conductor-to-contact interface. Whatever your requirement, Glenair has both the connectors, and the accessories, to put

*Glenair is the world's largest supplier of EMI Shielding backshells, cable sealing backshells and strain-relief devices. Over 65,000 part numbers are in stock and ready for same-day shipment*

*This section includes just a small selection of the most practical connector accessories designed for use on D38999 connectors*

*Glenair offers both AS85049 QPL solutions as well as a broad selection of commercial designs for every electrical, mechanical and environmental requirement.*

For example, effective shielding of avionic devices equipped with D38999 signal connectors must anticipate both "radiated susceptibility" (the degree to which outside interference affects the reliable functioning of equipment) and "radiated emissions" (the extent to which the device itself creates electromagnetic waves which can affect its function). In both cases, managing the interference

together a finished cable design that meets all the requirements of your application.

Figure 1

### Glenair Swing-Arm Offers Extremely Fast and Trouble-Free Termination of EMI Shielding:

Choose Straight, 45° or 90° angle, and tighten screws to lock arms in place. Leave the saddle clamp hardware loose.

Next, insert the wire bundle into the backshell to determine if the braid transition angle from the backshell to wire bundle is less than 45°. If it is less than 45°, build up the wire bundle with tape and re-insert wire bundle into backshell to support the transition of overall braid from the backshell to the wire bundle.

Loosely assembly the adapter to the connector and push back the backshell braid. Insert the wire bundle into the adapter and bottom it against the connector. Holding the cable, mark or tag the location where the shield support ring (Glenair Part Number 687-207) will be located. This distance may vary depending on your technique and the flexibility of the wire bundle immediately to the rear of the saddles (Figure 1).

Figure 2

Figure 3

Figure 4

Install Glenair's *Band-it*® band (600-052) between the lace ties onto the center of the support ring as shown in Figure 2. The hand banding tool (600-058) or pneumatic banding tool (600-067) is used for this banding process.

Next, you can wrap the shield support ring assembly with high temperature tape. Place lacing cord, high temperature tape, or high temperature plastic Ty-Straps on the braid transition to the rear of the backshell to secure the overbraid on wire bundle. If you wish, you can cover the overbraid with 102-080 braid sock.

Tighten the adapter to the connector using Glenair 600-091 composite hex coupling torque wrench and related tooling accessories to established torque values. Secure the strain relief saddle onto the wire bundle using TG69 soft jaw pliers. Torque the saddle screws to established values. You can use Fluoropolymer tape wrap or M85049/127 bushing strip as needed to cushion the braid sock under the saddle clamps.

With these few steps, your Swing-Arm strain relief installation is complete!

At the marked location, near the shield support ring, wrap tape around wire bundle for snug fit of shield support ring (Figure 1). Tape wrap is optional.

You can then slide the overall braid from the wire bundle side over the shield support ring, trimming braid ends and tucking extra braid underneath itself for a clean appearance.

For pin connectors, slide the backshell forward, and hand tighten backshell to connector. Then, evenly space shield pigtails (Figure 3) or solder sleeve pigtails (Figure 4) around the shield support ring. Cut the pigtails so that the end of the pigtails slightly beyond end of shield support ring.

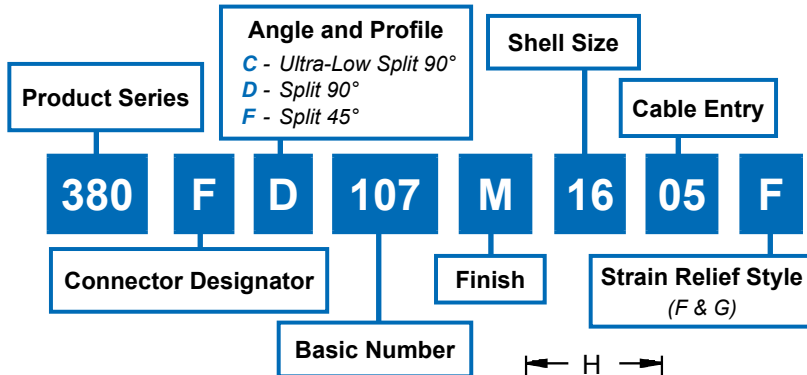

Bring the shield sock from backshell and completely cover the pigtails and support ring. Trim and fold the braid as shown in Figure 2. Lace tie the shield adjacent to support ring ends.

# What's Less than Half the Size and Weight of a D38999 Connector?

## The Glenair Series 80 “Mighty Mouse”

Nothing tells the “Mighty Mouse” story better than the above picture. If your goal is to maintain the performance standards of the D38999 but to reduce the size and weight of the overall interconnect system, than the Series 80 “Mighty Mouse” is the answer. The “Mighty Mouse” offers up to 71% weight savings when compared to aluminum versions of the D38999 Series III.

Compared to composite D38999's the savings top out at 64%. Size reduction is equally dramatic. And the Series 80 “Mighty Mouse” accomodates the same range of wire sizes as the D38999 and matches the product on critical performance requirements such as vibration and shock. Best of all, the product is in stock and ready for immediate shipment.

### VARIANCE CHART NOTES

- Torque values per SAE AIR6151, all values are provided in Inch/Pounds.
- For additional guidance or values/conditions not listed, refer to the complete SAE AIR6151.
- Heavy duty installation torque values (Column 2) may be difficult to obtain using the standard single wrap strap as supplied in the TG70. To achieve column 2 torque across all shell sizes a double wrap strap (using longer straps) is required as well as very careful placement of the tool and strap around the coupling to achieve maximum grip. Clean and oil-free surfaces are imperative.
- Glenair 600-006/079/103/107 circular pliers are also suitable for higher torque ranges.
- Glenair recommends that torque values be measured directly read through the connector shell using suitable holding tool from our 600-005 sockets and ply holder with the use of 600-005 connectors holding tools.
- Due to the offset of the 3/8" square drive from the centerline of the applied torque (centerline of the connector/backshell) offset torque values must be calculated by using any of the common offset value formulas or web apps that are readily available.

# The BAND-IT® Clamping System EMI Shield Termination Instructions

1. Prepare cable braid for termination process (Figure 1).
2. Push braid forward over adapter retention lip to the adapter incline point (or .4" [10.2mm] minimum braid length). Milk braid as required to remove slack and ensure a snug fit around the shield termination area (Figure 2).

3. Prepare the band in the following manner:

**IMPORTANT:** Due to Connector/Adapter circumference, it may be necessary to prepare the band around the cable or retention area.

- A. Roll band through the buckle slot twice (bands must be double-coiled).
- B. Pull on band until mark (▷) is within approximately .250 inch (6.4mm) of buckle slot (Figure 3). The band may be tightened further if desired.

**NOTE:** Prepared band should have (▷) mark visible as shown in Figure 3.

### Shield Termination Clamping Process (Figures 4 thru 8)

**NOTE:** To free tool handles, move holding clips to center of tool.

4. Squeeze gripper release lever and insert band into the front end opening of the tool (NOTE: Circular portion of looped band must always face downward).
5. Aligning the band and tool with the shield termination area, squeeze black pull-up handle repeatedly using short strokes until it locks against tool body. (This indicates the band is compressed to the tool precalibrated tension).

**NOTE:** If alignment of band and shield is unsatisfactory, tension on band can be relaxed by pushing on slotted release lever on top of tool. Make adjustments as necessary and again, squeeze black pull-up handle.

6. Complete the clamping process by squeezing the gray cut-off handle.
7. Remove excess band from tool and dispose.
8. Inspect shield termination.
